Monte Carlo Summary | Base Facts (Only Show Future Values)

This Monte Carlo Analysis runs multiple simulations of your financial plan against future market conditions. The result of introducing random investment volatility to the analysis produces a range of values that demonstrates how changing investment markets may impact your future plans.

Market Conditions	Percentile	Portfolio Assets
Above Average	80.0%	\$12,666,690
Median	50.0%	\$6,448,062
Below Average	20.0%	\$2,614,315

This Monte Carlo analysis illustrates the potential results of your financial plan using up to 1000 randomly generated market returns and volatility called trial runs. In each trial run, the mean and standard deviation of a selected benchmark index for each account or portfolio is used for a randomly chosen year. This hypothetical investment performance is combined with the detailed cash flow and tax calculations for your plan. The trial runs produce a range of potential results and are one way of illustrating and evaluating the statistical probability of your planning strategies.

IMPORTANT: The projections generated by this Monte Carlo simulation regarding the likelihood of various investment outcomes do not reflect or guarantee future results and may vary with each use and over time. Calculations are based upon market index and growth rate assumptions in your plan. Refer to the Assumptions Summary and Monte Carlo Assumptions reports for details.

Cash Flow | Base - Life Expectancy 80 (All Years) (Only Show Future Values)

The Cash Flow report illustrates your income, savings, expenses, and resulting net cash flow on an annual basis.

Monte Carlo Summary | Base - Life Expectancy 100 (Only Show Future Values)

This Monte Carlo Analysis runs multiple simulations of your financial plan against future market conditions. The result of introducing random investment volatility to the analysis produces a range of values that demonstrates how changing investment markets may impact your future plans.

Market Conditions	Percentile	Portfolio Assets
Above Average	80.0%	\$19,631,458
Median	50.0%	\$7,501,897
Below Average	20.0%	\$627,300

This Monte Carlo analysis illustrates the potential results of your financial plan using up to 1000 randomly generated market returns and volatility called trial runs. In each trial run, the mean and standard deviation of a selected benchmark index for each account or portfolio is used for a randomly chosen year. This hypothetical investment performance is combined with the detailed cash flow and tax calculations for your plan. The trial runs produce a range of potential results and are one way of illustrating and evaluating the statistical probability of your planning strategies.

IMPORTANT: The projections generated by this Monte Carlo simulation regarding the likelihood of various investment outcomes do not reflect or guarantee future results and may vary with each use and over time. Calculations are based upon market index and growth rate assumptions in your plan. Refer to the Assumptions Summary and Monte Carlo Assumptions reports for details.
